Pill Box

MAKE	BALAJI ENTERPRISES
MODEL	PLBX2.8

Usage	Technical Specification
Pilling is a fabric surface fault characterized by little pills of entangled fibers clinging to the surface. These give a very unsightly look to the garments. Pilling tester is used to determine the pilling property of fabrics.	Pilling tester (digital pilling tester) consists of two wooden boxes of exact dimensions, with inside surfaces lined with standard cork sheets and outside surfaces beautifully laminated. These boxes should rotate about their central axis at a specified speed with the help of a geared motor. A pre-set digital counter stops the motor automatically after the desired number of revolutions. The test specimens are firmly held around standard pilling (rubber) tubes. Four such tubes are placed in each box and then rotated for desired number of revolutions after which they are taken out and assessed visually against standard rating photographs and graded. Should be supplier with standard photographs.
